1. INTRODUCTION

This document provides an overview of integration procedure for consumer care library in iOS mobile applications.

Digital care library provides set of standardized consumer care support features which can be used in all Philips apps.

2. INTEGRATION

2.1 Cocoa pod Integration

The easiest and preferred way to use these components is using Cocoapods (version 0.36.0 or newer). In your podfile, you have to add a source line for the Philips internal pod spec repository. So a minimal Podfile would look like this:

Source: <https://atlas.natlab.research.philips.com/stash/scm/ehpmat/cocoapod-specs.git>

```
pod PhilipsConsumerCare, '~> 4.2.0'
```

Please refer sample app to add dependent libraries.

Integrating application can get the Library, Include and Bundle files from the below path,

Source>DigitalCareLibrary > DCLibArtifacts

2.2 Library Integration

1. Git source path :
`https://atlas.natlab.research.philips.com/stash/scm/cc/consumer_care_ios.git` **Branch: PI16.2Final**
2. Check out the code from above path where in you can find sample app which depends on consumer care library's .a file.
3. Consumer care needs other libraries to build which are as below
 - a. PhilipsAppTagging.a pod 'PhilipsAppTagging', '~> 0.2'
 - b. liblocaleMatch.a pod 'PhilipsLocalMatch', '~> 0.3'
 - c. PhilipsUIKit >= 3.1.0 pod 'PhilipsUIKit', '~> 3.0'
 - d. PhilipsIconFont >= 1.1 pod 'PhilipsIconFont', '~> 1.1'

- e. AFNetworking (<https://github.com/AFNetworking/AFNetworking>) pod 'AFNetworking', '~> 3.0'
- f. MBProgressHUD (MBProgressHUD.h, .m - <https://github.com/jdg/MBProgressHUD>) pod 'MBProgressHUD', '~> 0.9.2'
- g. PRXLib (libPRXClient.a - <http://pww.clscmgit.pic.philips.com:9000/scm/git/hor-prxclient-ios>)

Please take the PI16.1 release branch for PRXLib and also available in pod 'PhilipsPRXClient', '~> 1.0.0'

h. AdobeMobileLibrary.a

- i. ProductSelectionLib (libProductSelection.a –

https://atlas.natlab.research.philips.com/stash/scm/cc/productselection_ios.git

Please take the PI16.2 release branch for ProductSelectionLib and also available in pod 'PhilipsProductSelection', '~> 1.1.7'

Note:- Please make sure if ProductSelection is added via static library integrating app have to add the libProductSelection.a, ProductSelectionResources.bundle and header files available at GIT repo PI16.2 tagged version 1.1.7

Folder path -> hor-productselection-ios/Source/ProductSelection/Artifacts/

Please make sure all these are added to application's build phase.

4. Please copy DigitalCareConfiguration.plist from library's DigitalCareBundle.bundle to application's folder and override the attributes.
5. Override the values in config file and define the features as per requirement.

2.3 Library versioning

Library version can be obtained by using below API

[DCHandler getDCLibraryVersion];

2.4 Prerequisites

1. Application need to know **CTN** number for each product used in app Ex: HD8967/01 2. Along with sector and catalog. Example: **Sector** : B2C and **catalog**: CARE (Mandatory for Consumer care) Most of the apps will have above sector and catalog.

Above information is used for backend services and mostly uses PRX system. Hence please provide valid and complete CTN number as input otherwise consumer care features are not functional as expected.

3. INITIALIZATION

a. App can invoke the library using below API by importing "DCHandler.h",
[DCHandler invokeDigitalCareWithParentController:self delegate:self
withTransition:ANIMATIONSWIPERIGHT **productModelSelection:hardcodedList**
andCompletionHandler:^(void){}]

Below animations are supported currently,
ANIMATIONSWIPERIGHT, ANIMATIONSWIPELEFT, ANIMATIONSWIPETOP,
ANIMATIONSWIPEBOTTOM, NOANIMATION '

b. PhilipsUIKit:-

The Multiproduct Selection component uses the PhilipsUIKit for the UI components. So the applications that are already using PhilipsUIKit need not do anything. Applications that are not using the PhilipsUIKit have to assign the theme, else it will use the default blue theme for MultiproductSelection.

Configuring the theme:

```
[[PUIThemeManager sharedInstance] setDefaultTheme:  
[PUITheme blueDark] applyNavigationBarStyling:YES];
```

[PhilipsUIKit Documentation](#)

c. For supporting MultiproductSelection we have introduced new parameterName in the invoking method '**productModelSelection(PSHardcodedProductList*)hardcodedList**'. Vertical app has to set this parameter values before invoke method. This is applicable for single as well as multiple products and depends on the array size consumer care will launch the multiproductselection library in consumer care .

Apart from this Vertical must set the SECTOR and CATALOG values as mentioned in the below enum's.

Catalog Types Available :-

```
CATALOG_DEFAULT,  
CONSUMER,  
NONCONSUMER,
```

CARE,
PROFESSIONAL,
LP_OEM_ATG,
LP_PROF_ATG,
HC,
HHSSHOP,
MOBILE,
EXTENDEDCONSENT

Sector Types Available:-

DEFAULT,
B2C,
B2B_LI,
B2B_HC

Ex:-

```
PSHardcodedProductList *hardcodedList = [[PSHardcodedProductList
alloc] initWithArray:[NSArray
arrayWithObjects:@"HX9371/04",@"HF3330/01",@"HP6581/03",@"HP8656/0
3",@"S9031/26",@"SCF693/17",@"SCF145/06",@"FC6168/62",@"GC9550/02"
",@"PR3743/00", nil]];
```

```
hardcodedList.catalog=CARE;
```

```
hardcodedList.sector=B2C;
```

```
[DCHandler invokeDigitalCareWithParentController:self
delegate:self withTransition:ANIMATIONSWIPERIGHT
productModelSelection:hardcodedList andCompletionHandler:^(void) {
}];
```

Note: Please make sure that consumer product info class is removed , as we are getting the product information from PRX Server.

3.1 Digital care Configuration

The application has to copy DigitalCareConfiguration.plist from library resource bundle and create one in app resource bundle by overriding the parameters present in it. The file contains the following,

- UI resources like themes, styles, background colors and strings
- Facebook page id or page name and twitter page name for respective Philips product page.

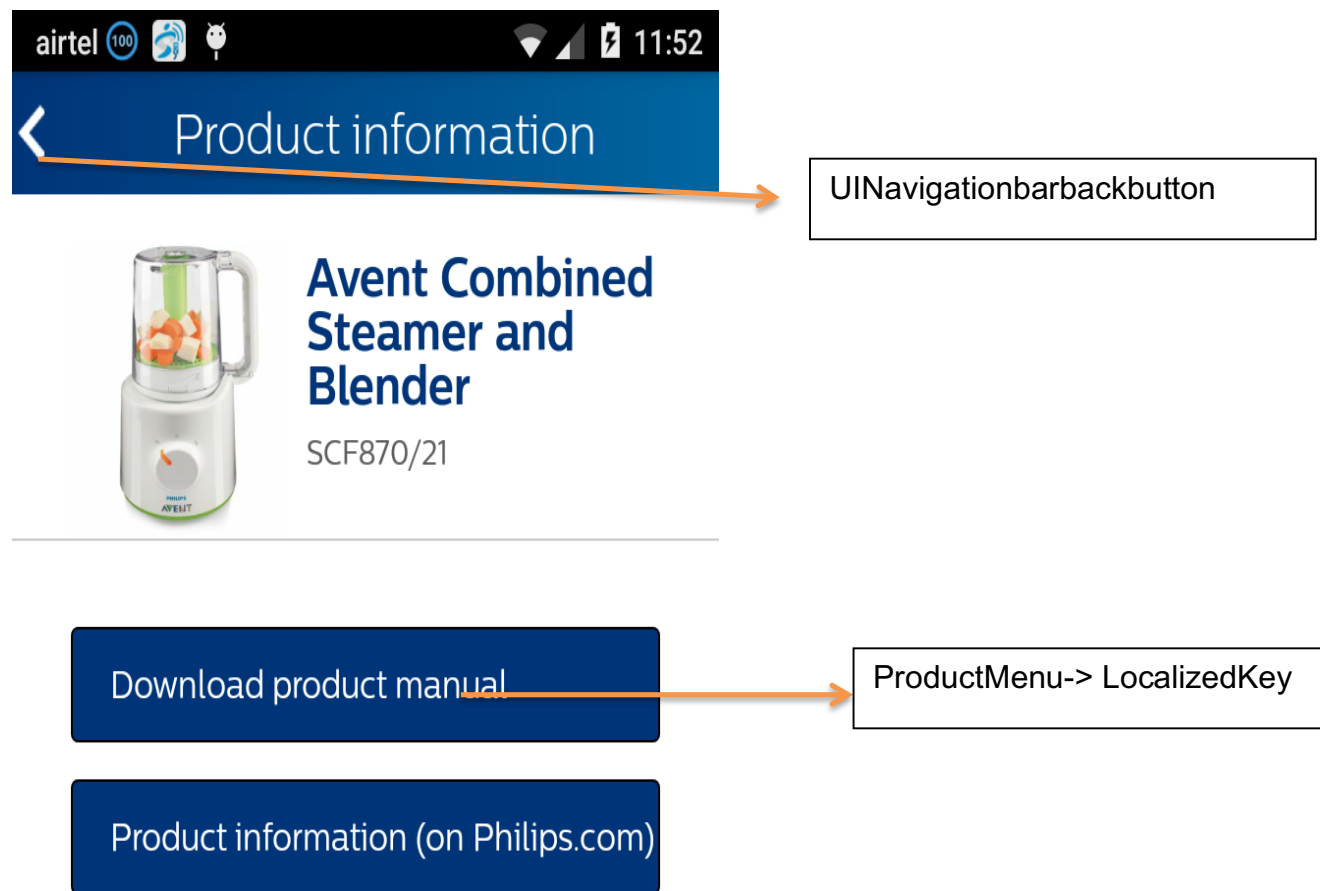

Note: If applications having both facebook page name and page id it will take the page name. If pagename is empty it will check for page id and will be setted.

- App store id for the app can be added in the FeedbackMenu for app feedback.
- An array is defined for defining main menu title, main menu icons, product menu title and social provider list. Each menu contains default features supported by Digital Care library. App can include only the required features by adding/deleting/modifying the array items.

- e. Each title string in above arrays is expected to be a resource key and not the value.
- f. ProductionEnvironment is added where in apps can mention whether it is production or test environment. This is applicable for all backend systems which we use.

3.1.1.1 Main menu configuration**HamburgerMenuIcon****NavigationBarStartColor**
NavigationBarEndColor**NavigationBarTitleColor****HeaderTextColor****ButtonBackgroundColor****ScreenBackgroundColor****ButtonTextColor****Localisedkey under Main Menu****IconName under Main Menu****RegisterButtonBackgroundColo**

3.1.1.2 Product menu configuration

Product videos

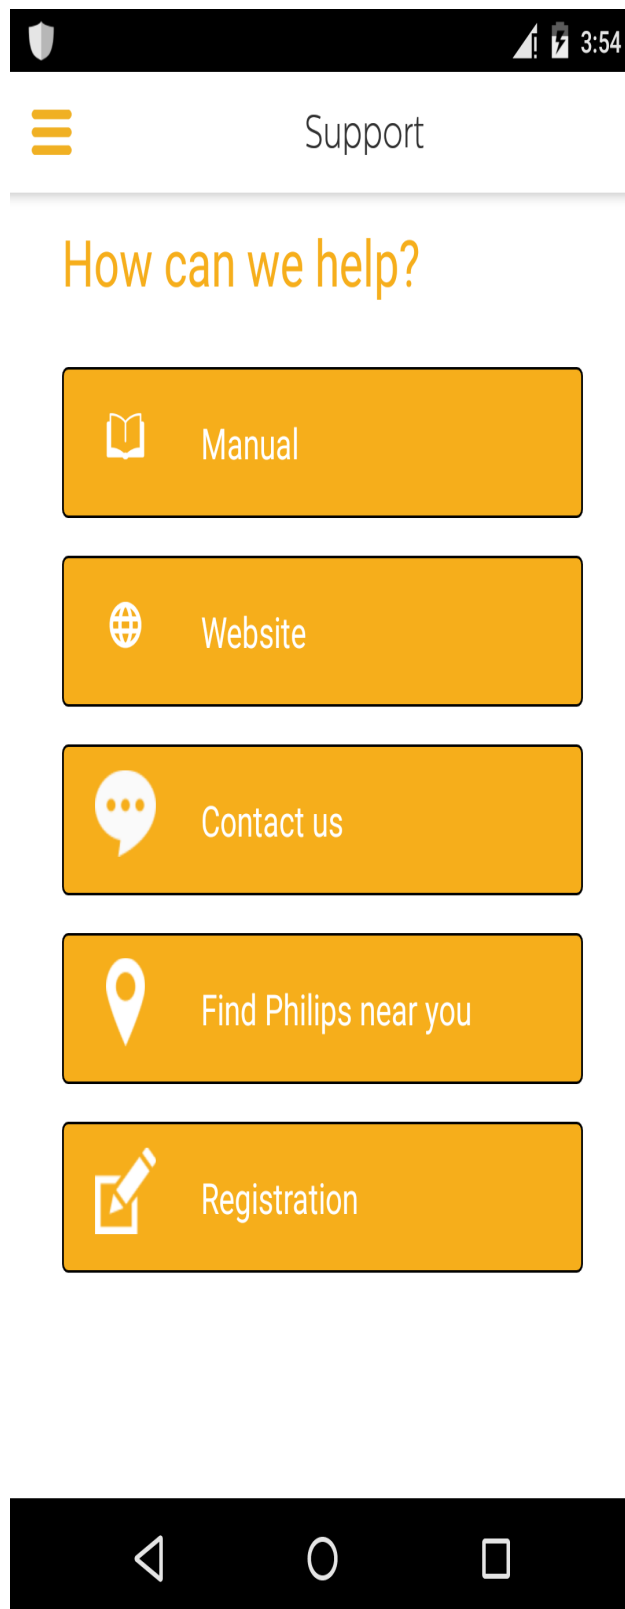

3.1.1.3 Social provider configuration

4. Vertical features customization

- a. App can add its own button by passing valid string for button title and icon resource name in configuration file.
- b. Also application has to implement protocols like MainMenuDelegate, ProductMenuDelegate, and SocialProviderDelegate.
 - i. MainMenuDelegate – Invoked on click of each button on support home page. This helps in configuring features on main/home page.
 - ii. ProductMenuDelegate – Invoked on click of each button on product info page. This helps in configuring features on product info page.
 - iii. SocialProviderDelegate – Invoked on click of each social provider buttons in Contact us page. This helps in configuring list of social list providers. CC by default supports Facebook and Twitter.
- c. App is required to implement all these to take control on app side for the menu items which is added by verticals. For digital care menu item, library is supposed to take action and app should not ideally override this.
- d. If app returns “true” then it means that app will take action on click of that button and library will not perform anything in that case otherwise library will take action if app returns “false”.

Example : Air Fryer customization

5. Navigation bar customization

Here is how we customize navigation bar in consumer care module,

1. We allow customization of both Hamburger menu icon and back arrow button in navigation bar.
2. Projects which uses navigation bar will go for above option.
3. Projects where in navigation bar is not used, will have to do the following
 - a. Replace hamburger menu icon with back arrow icon.
 - b. Set navigation bar background color same as screen background color.
 - c. Sets a boolean in config file which says hamburger menu title required as "False", in this case navigation bar title will not be shown in consumer care.
 - d. On click of customized hamburger menu, a delegate is set(if HamburgerIconControlRequired = YES in config file) and in android it just navigates to previous activity/fragment.
4. Projects which uses spring board, replaces hamburger menu with spring board icon.
5. On invoking DigitalCare Library while passing the parentviewController as parameter we are allowing if parentviewController is having UINavigationController or parentviewController itself is a navigationController the app will launch its navigation controller. This case no customization is required for DigitalCare library navigation bar.

6. Tagging

Apps must provide app id or tracking identifier to consumer care component through this API

```
[DCHandler setAppIdForTagging:@""];
```

Apps must provide previous pagename for tagging like below

```
[DCHandler setPreviousPageNameForTagging:@""];
```

Apps can also enable/disable tagging like below

```
[DCHandler setShouldTrackAnalytics:YES];
```

If app enables tagging and appid is not set, then digital care library will throw runtime exception.

7. CustomNavigationBarUISupport

Apps which are using custom navigation bar facing any issue in top constraint (top getting moved up) can set this api which return a float value.

```
[DCHandler setCCUITopConstraint:50.0];
```

If not it will take the default value 0.

8. Localization support

English	German	French (FR)	Simplified Chinese	Traditional Chinese	Portuguese (EU)
Russian	Arabic	Japanese	Dutch	Malay	Montenegrin
French-CA	Romanian	Spanish Mexican	Ukrainian	Portuguese (BR)	Serbian
Gaelic	Greek	Hebrew	Hindi	Finnish	Swedish
Italian	Polish	Spanish	Korean	Czech	English UK
Norwegian	Albanian	Bosnian	Bulgarian	Croatian	Estonian
Hungarian	Indonesian	Kazakh	Latvian	Lithuanian	Macedonian
Slovak	Slovenian	Spanish (AR)	Thai	Vietnamese	Danish
Farsi	Turkish				

9. FAQ

a. How about customising fonts and sizes?

We use Central Sans Font as per Philips design guidelines. Both fonts and sizes cannot be configured as of now.

b. Can we add our own buttons inside consumer care?

Yes. However we have restricted this to main menu screen, product menu and list of social service providers list.

c. Does Consumer care support App Tagging?

Yes. Please make sure you call enableTagging and provide apps ID. Please check sample app for more details. Unless App calls enableTagging () API tagging will not be enabled inside consumer care.

d. Where do I find my product information?

Each business has to provide complete ctn number including slash
Ex: HD9240/90

With this please check below link which helps in finding out product tree information like category, sub category etc. please add relevant ctn number

- a. https://www.philips.co.uk/prx/product/B2C/en_GB/CONSUMER/products/HD9240/90.summary
- b. http://nlvu077.gdc1.ce.philips.com:9080/repobrowser/catalogBrowse.r.jsp?catalogid=catalog_CL_CONSUMER&catalogType=CONSUMER&country=CL&language=es

Please replace locale to check whether product data is available in corresponding countries.

e. Does Consumer care support multiple products?

Yes, it supports multiple products from 16.1 release which has version 4.0.0 onwards.

.

Currently app can send hardcoded list of products as input after which consumer care will take care of selection of product.

10. Notes

- a. Registration is developed as separate library project. App is expected to invoke registration library on click of registration button inside consumer care support page.
- b. Integrating application has to add the list of custom font's which is used in the sample application for DigitalCareLibrary ,which is mentioned in the LibraryIntegrationSample app info.plist.
- c. Please refer sample application for more details.
- d. Consumer Care 4.2.0 version will give support from iOS 8 and greater.
